

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

1. (currently amended): A mobile communication terminal equipped with an Internet browser function, comprising:  
  
means for fetching melody data from a web-based server apparatus by using said browser function; and  
  
tone setting means that generates ringing tones by using tone information contained in said melody data,  
  
wherein said tone setting means generates ringing tones by performing a modulation processing on a tone representative of the melody data based on said tone information contained in said melody data.
2. (previously presented): The mobile communication terminal according to claim 1, wherein if said melody data contains no tone information, said tone setting means generates a ringing tone based on preset tone information.
3. (original): The mobile communication terminal according to claim 1, wherein if said melody data contains tone information, said tone setting means judges the validity of said tone information.

**4. (canceled).**

5. (currently amended): The mobile communication terminal according to ~~claim 4~~ claim 3, wherein said tone information contained in said melody data constitutes tone parameters used for said modulation processing.

6. (original): The mobile communication terminal according to claim 2, further comprising:

ringing-speed setting means for setting a tempo at which a melody is played in accordance with said melody data.

7. (original): The mobile communication terminal according to claim 5, further comprising:

ringing-speed setting means for setting a tempo at which a melody is played in accordance with said melody data.

8. (currently amended): A ringing method for a mobile communication terminal equipped with an Internet browser function, comprising:

having access to a web-based server equipment by means of said browser function;

notifying said server equipment of desired melody data in conformity with said access;

receiving said desired melody data from said server equipment;  
storing said received desired melody data;  
judging whether said stored melody data contains tone information;  
fetching said tone information if it is judged that said melody data contains the tone  
information;  
generating a tone for playing a melody in accordance with said melody data, by using  
said fetched tone information; and  
playing said melody in said set tone,  
wherein said ringing tones are generated by performing a modulation processing on the  
tone based on said tone information contained in said melody data.

9. (previously presented): The ringing method for a mobile communication terminal according to claim 8, wherein if said melody data contains no tone information, a ringing tone is generated based on preset tone information.

10. (previously presented): The ringing method for a mobile communication terminal according to claim 8, wherein if said melody data contains tone information, the validity of said tone information is judged.

**11. (canceled).**

12. (currently amended): The ringing method for a mobile communication terminal according to ~~claim 11~~, claim 10, wherein said tone information contained in said melody data constitutes tone parameters used for said modulation processing.

13. (previously presented): The ringing method for a mobile communication terminal according to claim 9, further comprising setting a tempo at which a melody is played in accordance with said melody data.

14. (previously presented): The ringing method for a mobile communication terminal according to claim 12, further comprising setting a tempo at which a melody is played in accordance with said melody data.
